nag_binary_factor_service (g11sbc)

1 Purpose

`nag_binary_factor_service (g11sbc)` is a service function which may be used prior to calling `nag_binary_factor (g11sac)` to calculate the frequency distribution of a set of dichotomous score patterns.

2 Specification

```
#include <nag.h>
#include <nagg11.h>
void nag_binary_factor_service (Nag_OrderType order, Integer p, Integer n,
                               Integer *ns, Nag_Boolean x[], Integer pdx, Integer irl[], NagError *fail)
```

3 Description

When each of n individuals responds to each of p dichotomous variables the data assumes the form of the matrix X defined below

$$X = \begin{bmatrix} x_{11} & x_{12} & \dots & x_{1p} \\ x_{21} & x_{22} & \dots & x_{2p} \\ \vdots & \vdots & & \vdots \\ x_{n1} & x_{n2} & \dots & x_{np} \end{bmatrix} = \begin{bmatrix} \underline{x}_1 \\ \underline{x}_2 \\ \vdots \\ \underline{x}_n \end{bmatrix},$$

where the x take the value of 0 or 1 and $\underline{x}_l = (x_{l1}, x_{l2}, \dots, x_{lp})$, for $l = 1, 2, \dots, n$, denotes the score pattern of the l th individual. `nag_binary_factor_service (g11sbc)` calculates the number of different score patterns, s , and the frequency with which each occurs. This information can then be passed to `nag_binary_factor (g11sac)`.

4 References

None.

5 Arguments

1: **order** – Nag_OrderType *Input*

On entry: the **order** argument specifies the two-dimensional storage scheme being used, i.e., row-major ordering or column-major ordering. C language defined storage is specified by **order** = Nag_RowMajor. See Section 3.2.1.3 in the Essential Introduction for a more detailed explanation of the use of this argument.

Constraint: **order** = Nag_RowMajor or Nag_ColMajor.

2: **p** – Integer *Input*

On entry: p , the number of dichotomous variables.

Constraint: **p** ≥ 3 .

3: **n** – Integer *Input*

On entry: n , the number of individuals in the sample.

Constraint: **n** ≥ 7 .

4:	ns – Integer *	<i>Output</i>
<i>On exit:</i> the number of different score patterns, s .		
5:	x[dim] – Nag_Boolean	<i>Input/Output</i>
Note: the dimension, dim , of the array x must be at least		
$\max(1, \mathbf{pdx} \times \mathbf{p})$ when order = Nag_ColMajor; $\max(1, \mathbf{n} \times \mathbf{pdx})$ when order = Nag_RowMajor.		
Where $\mathbf{X}(i, j)$ appears in this document, it refers to the array element		
$\mathbf{x}[(j - 1) \times \mathbf{pdx} + i - 1]$ when order = Nag_ColMajor; $\mathbf{x}[(i - 1) \times \mathbf{pdx} + j - 1]$ when order = Nag_RowMajor.		
<i>On entry:</i> $\mathbf{X}(i, j)$ must be set equal to Nag_TRUE if $x_{ij} = 1$, and Nag_FALSE if $x_{ij} = 0$, for $i = 1, 2, \dots, n$ and $j = 1, 2, \dots, p$.		
<i>On exit:</i> the first s rows of x contain the s different score patterns.		
6:	pdx – Integer	<i>Input</i>
<i>On entry:</i> the stride separating row or column elements (depending on the value of order) in the array x .		
<i>Constraints:</i>		
if order = Nag_ColMajor, pdx $\geq \mathbf{n}$; if order = Nag_RowMajor, pdx $\geq \mathbf{p}$.		
7:	irl[n] – Integer	<i>Output</i>
<i>On exit:</i> the frequency with which the l th row of x occurs, for $l = 1, 2, \dots, s$.		
8:	fail – NagError *	<i>Input/Output</i>
The NAG error argument (see Section 3.6 in the Essential Introduction).		

6 Error Indicators and Warnings

NE_ALLOC_FAIL

Dynamic memory allocation failed.

See Section 3.2.1.2 in the Essential Introduction for further information.

NE_BAD_PARAM

On entry, argument $\langle value \rangle$ had an illegal value.

NE_INT

On entry, **n** = $\langle value \rangle$.
Constraint: **n** ≥ 7 .

On entry, **p** = $\langle value \rangle$.
Constraint: **p** ≥ 3 .

On entry, **pdx** = $\langle value \rangle$.
Constraint: **pdx** > 0 .

NE_INT_2

On entry, **pdx** = $\langle value \rangle$ and **n** = $\langle value \rangle$.
Constraint: **pdx** $\geq \mathbf{n}$.

On entry, $\mathbf{pdx} = \langle value \rangle$ and $\mathbf{p} = \langle value \rangle$.
 Constraint: $\mathbf{pdx} \geq \mathbf{p}$.

NE_INTERNAL_ERROR

An internal error has occurred in this function. Check the function call and any array sizes. If the call is correct then please contact NAG for assistance.

An unexpected error has been triggered by this function. Please contact NAG.
 See Section 3.6.6 in the Essential Introduction for further information.

NE_NO_LICENCE

Your licence key may have expired or may not have been installed correctly.
 See Section 3.6.5 in the Essential Introduction for further information.

7 Accuracy

Exact.

8 Parallelism and Performance

Not applicable.

9 Further Comments

The time taken by nag_binary_factor_service (g11sbc) is small and increases with n .

10 Example

This example counts the frequencies of different score patterns in the following list:

Score Patterns
000
010
111
000
001
000
000
110
